Events

Blocks in the Events menu/palette control when scripts are started.

They are also known as hat blocks, and they run the blocks below them when a particular event happens. They are rounded at the top, like a hat, so no blocks can go above them. Some of the events block include;

Mouse chase game

Aim

The aim of this game is to use the four arrow keys on our keyboard to control the movement of our cat sprite it chases the mouse.

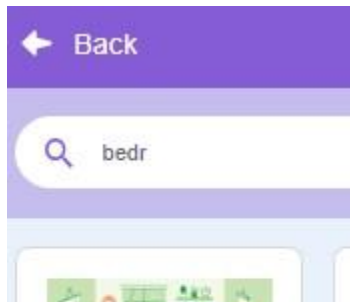

Requirements

Click on the add a sprite tab and add

- Cat sprite
- Mouse sprite

Atmosphere

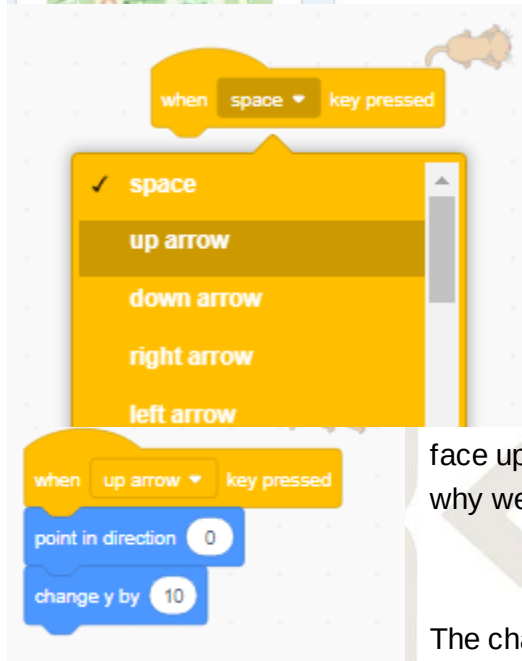

Choose a bedroom 1 backdrop from the backdrop menu. We are going to use this such that the cat can chase the mouse out of our bedroom.

Click on the choose a backdrop icon and a new window with backdrops will appear. Type bedroom 1 and click to add it to our stage.

Let's start coding!!

Cat's script

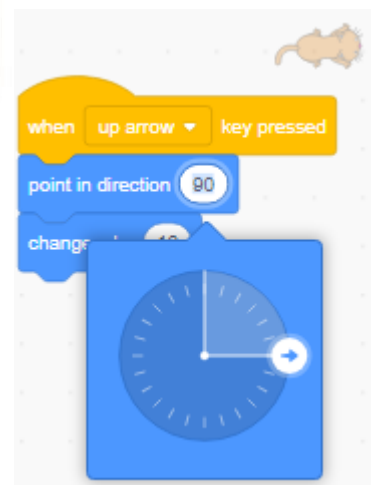

Click/ select the cat sprite from sprite's pane such that we can write code on it. Put when space key pressed code block on your coding area, click the drop-down button and select "up arrow".

We want the sprite to move and face upwards when the up arrow is pressed. So let's write code for that.

Use the point in direction block to make the sprite face upwards/northwards when the up arrow is faced. that is why we have 0° because it's facing up or north.

The change y block makes the sprite move vertically. This is because in coordinates when you move upwards, the y values are positive hence the change y by 10.

Now that you have understood how to use the point in direction and change y by blocks. Write the code for the cat when the down arrow is pressed. it should look like this. And yes, y this time is negative because we are moving downwards.

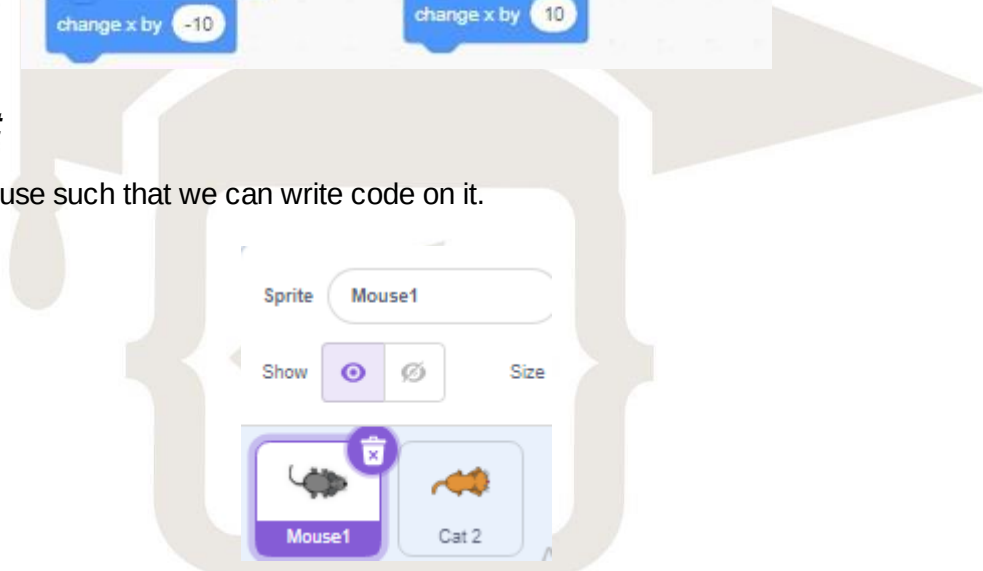

For our sprite to move to the left and right, we are going to use the left and right arrow keys.

This means our cat sprite is moving horizontally along the x axis, hence we are going to use change x by code block. Write the following scripts to activate the right and left arrow keys.

Mouse's script

Click on the mouse such that we can write code on it.

Now that we have selected it, we want the mouse to forever ran away whenever the cat touches it. To write this, use an if else code block, the touching code block for scratch to sense whenever it's touched as shown below.

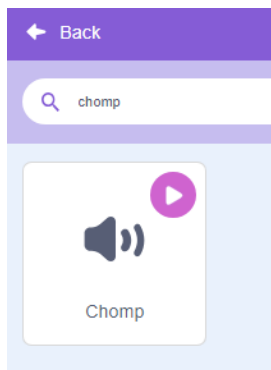

Tip: The if else block will execute the code block or action you put inside it if and only the condition is met (in this case if the mouse is touched by the cat).

Add a go to random block such that mouse goes to a random position if it is touched by the cat.

Sound is a very important aspect of every scratch project.

So, click on the sound tab, click add a sound icon and search for the “chomp” sound.

After adding the sound to the mouse, drag the play sound block and place under the go to random position.

Well-done, you have created a mouse chase game!!!!
